Statistics

Scientific data analysis
made easy

MHSG

Scientific data analysis made easy

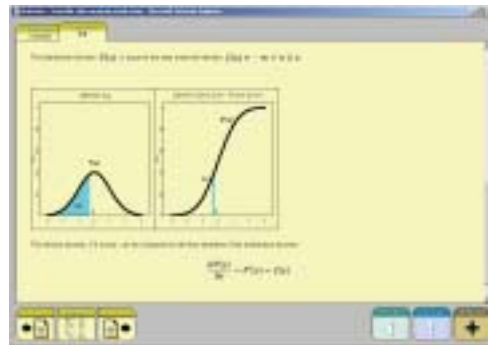

This interactive CD-ROM offers a new and exciting way to explore the fundamental principles of statistics.

In twelve lessons the classical subject areas of descriptive and inductive statistics are presented: basic statistical concepts, one-dimensional frequency distribution, probability calculation and combination theory, random variable and distribution models, sampling theory, estimation methods, statistical testing, two-dimensional frequency distribution, regression and time series analysis.

Each lesson is divided into different levels of complexity. The interactive structure enables you to tailor the learning process to your individual needs. A variety of examples, interactive calculation tools as well as intuitive links between individual lessons enhance your understanding of the subject matter.

With the help of bookmarks you can retrace the instructional components used during your last session. Spoken explanations reinforce your understanding of basic concepts. Multiple-choice exercises make a quick evaluation of your learning results possible.

The CD-ROM also contains a comprehensive glossary and a printable formula overview. This course is especially suited for students in economics, engineering and the natural sciences.

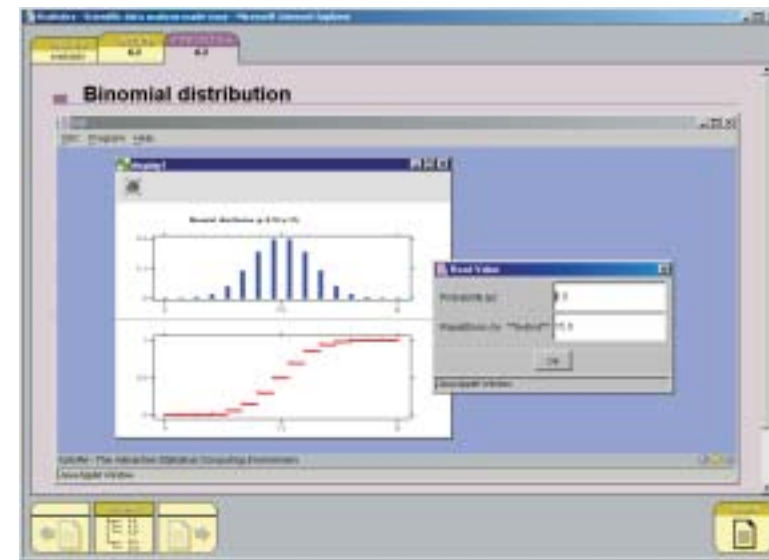

The Author

The authors, Prof. Dr. Wolfgang Härdle und Prof. Dr. Bernd Rönz of the Institute for Statistics and Econometrics at the Humboldt University in Berlin, developed this multimedia production in collaboration with MHSG. To find out more about the Institute and their work visit:
